3-10-24

This activity is about Linux Commands. You need to use Kali Linux to execute relevant commands and answer the questions specified in the tasks.

Attempt the following tasks on your system and write the commands / output on the space provided:

Activity 1 [13]

Fire up your kali machine as kali user and start the terminal.

Create three new users user1, user2, and user3. Provide same passwords to each, for example calssActivity-1. Write down the commands used to create users. [3]

sudo adduser user1 ✓

~~sudo adduser user1~~

sudo adduser user2 ✓

sudo adduser user3 ✓

3

Now get following information about the users you have just created: [10]

UID of user1 [1]

1001 ✓

UID of user2 [1]

1002 ✓

UID of user3 [1]

1003 ✓

The hashed password string of user1 [3]

~~\$g\$gT\$a..~~ X

3p4w035

1.5

The hashed password string of user2 [3]

~~\$g\$gT\$a..~~ X

msk81D

1.5

Now shut down kali and login again using one of the new users. What difference you see on your terminal? [1]

username is changed in prompt

user2@kali

1

Activity 2 [26]

Shut down kali and login with kali as user.

Create a file named file_ca1.txt inside /home/kali directory. Give the command to create the file. [1]

`touch file_ca1.txt`

Who is the owner of this file? What permissions are assigned to the owner? Write the command you used along with the related output. [2]

`ls -l file_ca1.txt`

read and write for owner.

`-rw-rw-r-- 1 kali kali 0 Oct 3 01:13 file_ca1.txt`

What is the name of group of this file? What permissions are assigned to the group? Write the command you used along with the related output. [2]

kali

group permissions: read and write

command: same as above : `ls -l file_ca1.txt`

`-rw-rw-r-- 1 kali kali`

Now change the owner of this file to user1 and check whether the change has been made effective. [3]

`sudo chown user1:kali file_ca1.txt`

`ls -l file_ca1.txt`

Create a new group named hackers. [4]

`sudo groupadd hackers`

Verify the group creation. Write the command you used to verify the group creation and the output you got. [2]

`getent group hackers`

`hackers:x:1004:`

Add user2 and user3 to this group. Write commands that add users to the group. [5]

`sudo usermod -g hackers user2`

`sudo usermod -g hackers user3`

Now list down the users in the group hackers. Specify the command. [4]

getent group hackers

output: hackers:x:1004:user2, user3

Now change the group of file_ca1.txt to hackers. Specify the command. [2]

sudo chown :hackers file_ca1.txt

~~*ls -l file_ca1.txt*~~

Give command used to check whether the changes have been incorporated or not. [1]

ls -l file_ca1.txt

Activity 3 [5, 6]

Create the following directories/files on your terminal. Write commands that you used to create these directories and files in the same sequence.

Suppose xyz is the root directory. You can create and move to this directory using following commands

\$ mkdir xyz

\$ cd xyz

Now that you are inside xyz, write commands to perform the following. Note that di means a directory and fi means a file. Also note that you must not leave the root directory for the following tasks. This means your PWD should be /home/kali/xyz

Create a directory d1 inside xyz.

xyz ~ \$ mkdir d1

Create a directory d4 inside d1

xyz ~ \$ ~~mkdir d1/d4~~ mkdir d1/d4

Create a directory d5 inside d1

xyz ~ \$ ~~mkdir d1/d5~~ mkdir d1/d5

Create a directory d2 inside xyz

xyz ~ \$ ~~mkdir d2~~ mkdir d2

Create a directory d3 inside d2

xyz ~ \$ mkdir d2/d3

Create a file f1 inside d4

xyz ~ \$ touch d1/d4/f1

create a file f2 inside d4

xyz ~ \$ touch d1/d4/f2

Create a directory d6 inside d5

xyz ~ \$ mkdir d1/d5/d6 ✓

Create a file f3 inside d3

xyz ~ \$ touch d2/d3/f3 ✓

Create a file f4 inside d6

xyz ~ \$ touch d1/d5/d6/f4 ✓

Draw a neat directory tree structure for the above directories and files. [6]

tree package for easy tree display:

sudo apt install tree

tree

xyz

6
